

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing Of Claims:**

Please amend the claims as follows:

1. (Currently Amended) A computer-implemented method for searching through ink characters within an electronic document comprising:
  - (a)-accepting, by a computer, a search query, where the search query comprises a search query word, a list of electronic documents, and at least one folder containing the electronic documents in the list of electronic documents wherein each document in the list of electronic documents comprises a plurality of text and ink words;
  - (b) retrieving a search query character from the search query word in the search query;
  - ~~(c)-accepting an ink a~~ word from the electronic document;  
determining if the document word is an ink word,  
in response to determining that the document word is an ink word, conducting an ink word match, wherein conducting an ink word match comprises:
    - (d) accepting an ink alternate word, wherein the ink alternate word is an estimation of the ink word[[:;]],
    - (e) retrieving an each of a plurality of ink alternate character characters for the ink alternate word[[:;]],

(f) determining, for each of the plurality of when the ink alternate character characters whether the each of the ink alternate characters matches the search query character~~[[;]], and~~

(g) ~~repeating stages (d) (f) for a plurality of ink alternate characters;~~

(h) returning a match list of each of the plurality of ink alternate character ~~matches resulting from stage (f);~~

determining if the document character is a text word; and  
in response to determining that the document character is a text word,  
conducting a text word match.

2. (Previously Presented) The computer implemented method of Claim 1 further comprising:  
 accepting another ink alternate character for the ink alternate word in response to a positive determination that the ink alternate character matches the search query character;

accepting another search query character from the search query word;  
 determining when the other ink alternate character matches the other search query character;

determining when the other search query character is the last character in the search query word in response to a positive determination that the other ink alternate character matches the other search query character; and

sending a match to the match list in response to a positive determination that the other search query character is the last character in the search query word.

3. (Previously Presented) The computer-implemented method of Claim 1 further comprising:
- determining when the search query contains another search query word;
  - retrieving a search query character of the other search query word in response to a positive determination that the search query contains the other search query word;
  - and
  - determining when the search query character of the other search query word matches the ink alternate character of the ink alternate word.
4. (Previously Presented) The computer-implemented method of Claim 1 further comprising:
- (a) accepting another ink alternate word in response to a determination that the ink alternate character does not match the search query character;
  - (b) retrieving an ink alternate character for the other ink alternate word;
  - (c) determining when the ink alternate character for the other ink alternate word matches the search query character; and
  - (d) repeating steps a-c for a plurality of ink alternate words.
5. (Original) A computer-readable medium having computer-executable instructions for performing the steps recited in Claim 1.

6. (Currently Amended) A computer-implemented method for searching within an electronic document comprising:

accepting, by a computer, a search query comprising a search query word to be sought in the electronic document, a list of electronic documents, and at least one folder containing the documents in the list of electronic documents wherein each document in the list of electronic documents comprises a plurality of text and ink characters;

determining when the search query word matches at least one set of characters in the electronic document comprising:

accepting the search query word from the search query;

retrieving one of a plurality of search query characters from the search query word,

accepting a document content character from the electronic document,

determining if the document character is an ink character;

in response to determining that the document character is an ink character, conducting an ink character match;

determining if the document character is a text character; and

in response to determining that the document character is a text character, conducting a text character match;

~~determining when the document content character is an ink character or a text character;~~

~~conducting a text character match in response to a determination that the document content character is a text character; and~~

~~conducting an ink character match in response to a determination that the first document content character is an ink character;~~

adding a match to a match list in response to a positive determination that the search query word matches the set of characters in the electronic document;

processing a boolean operator in the search query;

determining when the match to the first query word before the boolean operator and the match to the first query word after the boolean operator satisfy a spatial relationship, the spatial relationship being satisfied when the match to the first query word before the boolean operator and the match to the first query word after the boolean operator occur within a portion of the document currently displayed in a viewable area; and

displaying at least one match from the match list by highlighting the set of characters in the electronic document that correspond to the match of the search query.

7. (Previously Presented) The computer-implemented method of Claim 6 further comprising:

- (a) retrieving document content from the electronic document;
- (b) accepting at least one document content character from the document content;
- (c) determining when additional document content exists in the electronic document; and
- (d) repeating steps a-c for the additional document content.

8. (Cancelled)

9. (Previously Presented) The computer-implemented method of Claim 6, wherein processing a boolean operator in the search query comprises:

accepting the boolean operator from the search query;

accepting a match to a first query word before the boolean operator from the match list;

accepting a match to a first query word after the boolean operator from the match list;

determining when the match to the first query word before the boolean operator and the match to the first query word after the boolean operator satisfy a spatial relationship; and

removing from the match list the match to the first query word before the boolean operator and the match to the first query word after the boolean operator in response to a failure to satisfy the spatial relationship.

10. (Previously Presented) The computer-implemented method of Claim 9, wherein the spatial relationship is satisfied when the match to the first query word before the boolean operator and the match to the first query word after the boolean operator occur within the same paragraph of the electronic document.

11. (Previously Presented) The computer-implemented method of Claim 9, wherein the spatial relationship is satisfied when the match to the first query word before the boolean operator and the match to the first query word after the boolean operator occur within the same page of the electronic document.

12. (Original) The computer-implemented method of Claim 6, wherein the step of displaying the matches further comprises:

sorting the matches in the match list;

identifying the match in the match list that is closest to a match point in the electronic document;

navigating through the electronic document to the match closest to the match point; and

selecting the match closest to the match point.

13. (Original) The computer-implemented method of Claim 12, wherein the match point comprises the cursor location in the electronic document.

14. (Original) The computer-implemented method of Claim 12, wherein sorting the matches comprises sorting the matches in the match list by the page number in which the match is located in the electronic document.

15. (Previously Presented) The computer-implemented method of Claim 6 further comprising:

(a) sorting a plurality of matches in the match list by page number in the electronic document;

(b) accepting a first match and a second match from the match list;

(c) determining when at least one character is between the document content characters corresponding to the first match and the second match in the electronic document;

(d) merging the first match and the second match in the match list in response to a negative determination of at least one character between the document content characters corresponding to the first match and the second match;

(e) retrieving a next match in the match list; and

(f) repeating steps b-e for the plurality of matches in the match list.

16. (Cancelled)

17. (Previously Presented) The computer-implemented method of Claim 6, wherein conducting a text character match comprises:

comparing the document content character to the search query character to determine if the characters match;

determining when the search query word contains additional characters in response to a positive determination that the search query character matches the document content character;

retrieving another one of the search query characters in response to a positive determination that the search query word contains additional characters; and

sending a match to the match list in response to a negative determination that the search query word contains additional characters.

18. (Previously Presented) The computer-implemented method of Claim 17 further comprising:

determining when the electronic document comprises a next document content character in response to a negative determination that the search query character matches the document content character;

retrieving the next document content character in response to a positive determination that the electronic document comprises the next document content character; and

comparing the search query character to the next document content character to determine when the characters match.

19. (Previously Presented) The computer implemented method of Claim 18 further comprising:

determining when the search query contains another search query word;

retrieving a search query character of the other search query word in response to a positive determination that the search query contains the other search query word; and

comparing the document content character to the search query character of the other search query word to determine if the characters match.

20. (Previously Presented) The computer-implemented method of Claim 6, wherein conducting an ink character match comprises:

- (a) accepting an ink alternate word, wherein the ink alternate word is an estimation of the actual ink word received by the electronic document;
- (b) retrieving an ink alternate character for the ink alternate word;
- (c) determining when the ink alternate character matches the search query character;
- (d) accepting another ink alternate word in response to a determination that the ink alternate character does not match the search query character; and
- (e) repeating stages b-d for the other ink alternate word.

21. (Previously Presented) The computer implemented method of Claim 20 further comprising:

- accepting another ink alternate character for the ink alternate word;
- accepting another search query character from the search query word;
- determining when the other ink alternate character matches the other search query character;
- determining when the other search query character is the last character in the search query word in response to a positive determination that the other ink alternate character matches the other search query character; and

sending a match to the match list in response to a positive determination that the other search query character is the last character in the search query word.

22. (Previously Presented) The computer-implemented method of Claim 20 further comprising:

determining when the search query contains another search query word;

retrieving a search query character of the other search query word in response to a positive determination that the search query contains the other search query word;

determining when the search query character of the other search query word matches the ink alternate character of the ink alternate word.

23. (Previously Presented) The computer-implemented method of Claim 6 further comprising:

determining when the electronic document comprises additional document content characters;

retrieving a next document content character in response to a positive determination that the electronic document comprises additional document content characters; and

determining when the next document content character is an ink character or a text character.

24. (Original) A computer-readable medium having computer-executable instructions for performing the steps recited in Claim 6.

25. (Currently Amended) A computer-readable medium which stores a set of instructions which when executed performs a method for providing ink alternates and plain text search, the method executed by the set of instructions comprising:

accepting, in a computer, a search query comprising a search query word to be sought in the electronic document, a list of electronic documents, and at least one folder containing the electronic document wherein each electronic document in the list of electronic documents comprises a plurality of ink and text characters;

determining when the search query word matches at least one set of characters in the electronic document, wherein the at least one set of characters is selected from the group consisting of an ink character and a text character, wherein determining when the search query word matches at least one set of characters in the list of electronic documents comprises:

accepting the search query word from the search query,

retrieving one of a plurality of search query characters from the search query word,

accepting a document content character from the electronic document,

determining if the document character is an ink character;

in response to determining that the document character is an ink character, conducting an ink character match;

determining if the document character is a text character; and

in response to determining that the document character is a text character, conducting a text character match;

~~determining when the document content character is an ink character or a text character;~~

~~conducting a text character match in response to a determination that the document content character is a text character, and~~

~~conducting an ink character match in response to a determination that the first document content character is an ink character;~~

adding a match to a match list in response to a positive determination that the search query word matches the set of characters in the electronic document;

sorting a plurality of matches in the match list;

identifying a match in the match list that is closest to a match point in the electronic document;

processing a boolean operator in the search query, wherein the boolean operator satisfies a spatial relationship when the match to the first query word before the boolean operator and the match to the first query word after the boolean operator occur within a portion of the document currently displayed in a viewable area; and

highlighting the match closest to the match point.

26. (Original) The computer-readable medium having computer-readable instructions of Claim 25, wherein the match point comprises the cursor location in the electronic document.

27. (Original) The computer-readable medium having computer-readable instructions of Claim 25, wherein sorting the matches comprises sorting the matches in the match list by the page number in which the match is located in the electronic document.

28. (Original) The computer-readable medium having computer-readable instructions of Claim 25, wherein the search query comprises at least two search query words, further comprising the step of processing a boolean operator in the search query.

29. (Previously Presented) The computer-readable medium having computer-readable instructions of Claim 25, wherein processing a boolean operator in the search query comprises:

accepting the boolean operator from the search query;

accepting a match to a first query word before the boolean operator from the match list;

accepting a match to a first query word after the boolean operator from the match list;

determining when the match to the first query word before the boolean operator and the match to the first query word after the boolean operator satisfy a spatial relationship; and

removing from the match list the match to the first query word before the boolean operator and the match to the first query word after the boolean operator in response to a failure to satisfy the spatial relationship.

30. (Cancelled)
